Module 4: Sanitation

Version 2.0 (March 2026)

Our Learning

Goals

- 💧 **Sanitation** on our health and well-being
- 💧 Different types of **toilets**
- 💧 How do we **stop the spread of diseases** that come from waste?

Let's get started!

Topic 1

**Sanitation
and Health**

Introduction to Sanitation

“

Sanitation is when we build facilities and offer services for the safe disposal of human waste.

”

Why is sanitation important in our daily lives?

Quality of Life

“

Poor sanitation happens because:

- **Rural and underserved city areas** do not get the help they need
- The Philippines is very **densely populated** with people living across 7,600+ islands.
- **Natural disasters** happen more often and more severely due to Climate Change

”

Stops germs and sickness

Keeps our public and private spaces safe

Allows every Filipino to stay healthy and live quality lives!

How toilets affect our health and the environment

Topic 2

Different Toilet Types

Sanitary & Unsanitary Toilets

Sanitary Toilets

Separates human waste from human contact

Prevents the spread of diseases

Unsanitary Toilets

Allows unsafe contact between humans and their waste

Creates contamination in the environment and is dangerous to our health

Sanitary Toilet Types

Pour or Flush Type with a Containment Tank

Water is poured into the bowl to flush waste into a containment tank and is held until it is disposed of

Simple and affordable compared to other sanitary toilet types

Requires regular emptying and maintenance

Common in rural areas where sewer systems are not available

Pour or Flush Type with a Septic Tank

Water is poured into the bowl to flush waste into a septic tank for treatment using bacterial decomposition

More effective - emptied more often than containment tanks

Higher cost to install

Common in rural and urban areas where sewer systems are not available

Sanitary Toilet Types

Pour or Flush Type connected to a Septic Tank and Sewerage System

Waste is flushed into a septic tank and then moved to a sewerage system for treatment

Detailed waste management solution for households and communities

High installation and maintenance costs - it requires sewerage infrastructure to be built

Common in urban areas where sewer systems are not available

Can you describe the differences between these three sanitary toilet types? Which ones have you seen before?

Unsanitary Toilet Types

Water-Sealed Toilet without a Septic Tank

Uses water to seal the waste but lacks a septic tank for treatment

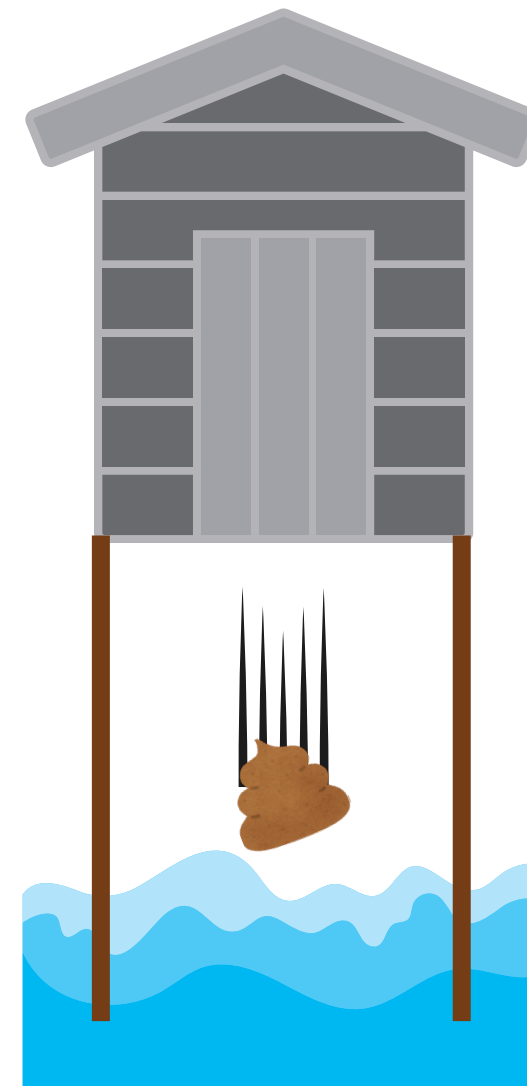

Environmental and health risks due to improper waste disposal

Common in informal settlements and areas with limited resources

Overhung Latrine (or Overhung Toilet)

Simple structure built over a body of water or a pit where the waste drops directly below

High risk of contaminating water sources and spreading diseases

Common in coastal and riverine rural areas

Sanitary Toilet Types

Open Pit Latrine (or Open Pit Toilet)

Simple pit dug into the ground where waste is deposited

Easily contaminates groundwater and attracts disease carriers like flies

Sometimes nearby water sources used by households and communities

Common in remote areas with limited access to sanitation facilities

If these three types of toilets are unsanitary, then why are they so commonly used?

WHY?

Unsanitary Toilets

Here are the main reasons that we still use unsanitary toilets here in the Philippines:

Financial challenges

Infrastructure limitations

Low cost

Ease of construction

Understanding how diseases can spread

Topic 3

What is the F-Diagram?

Introduction to the F-Diagram

1

2

3

4

5

Can you guess
what the five
“F”s are?

Introduction to the F-Diagram

1

Fingers

2

Flies

3

Fields

4

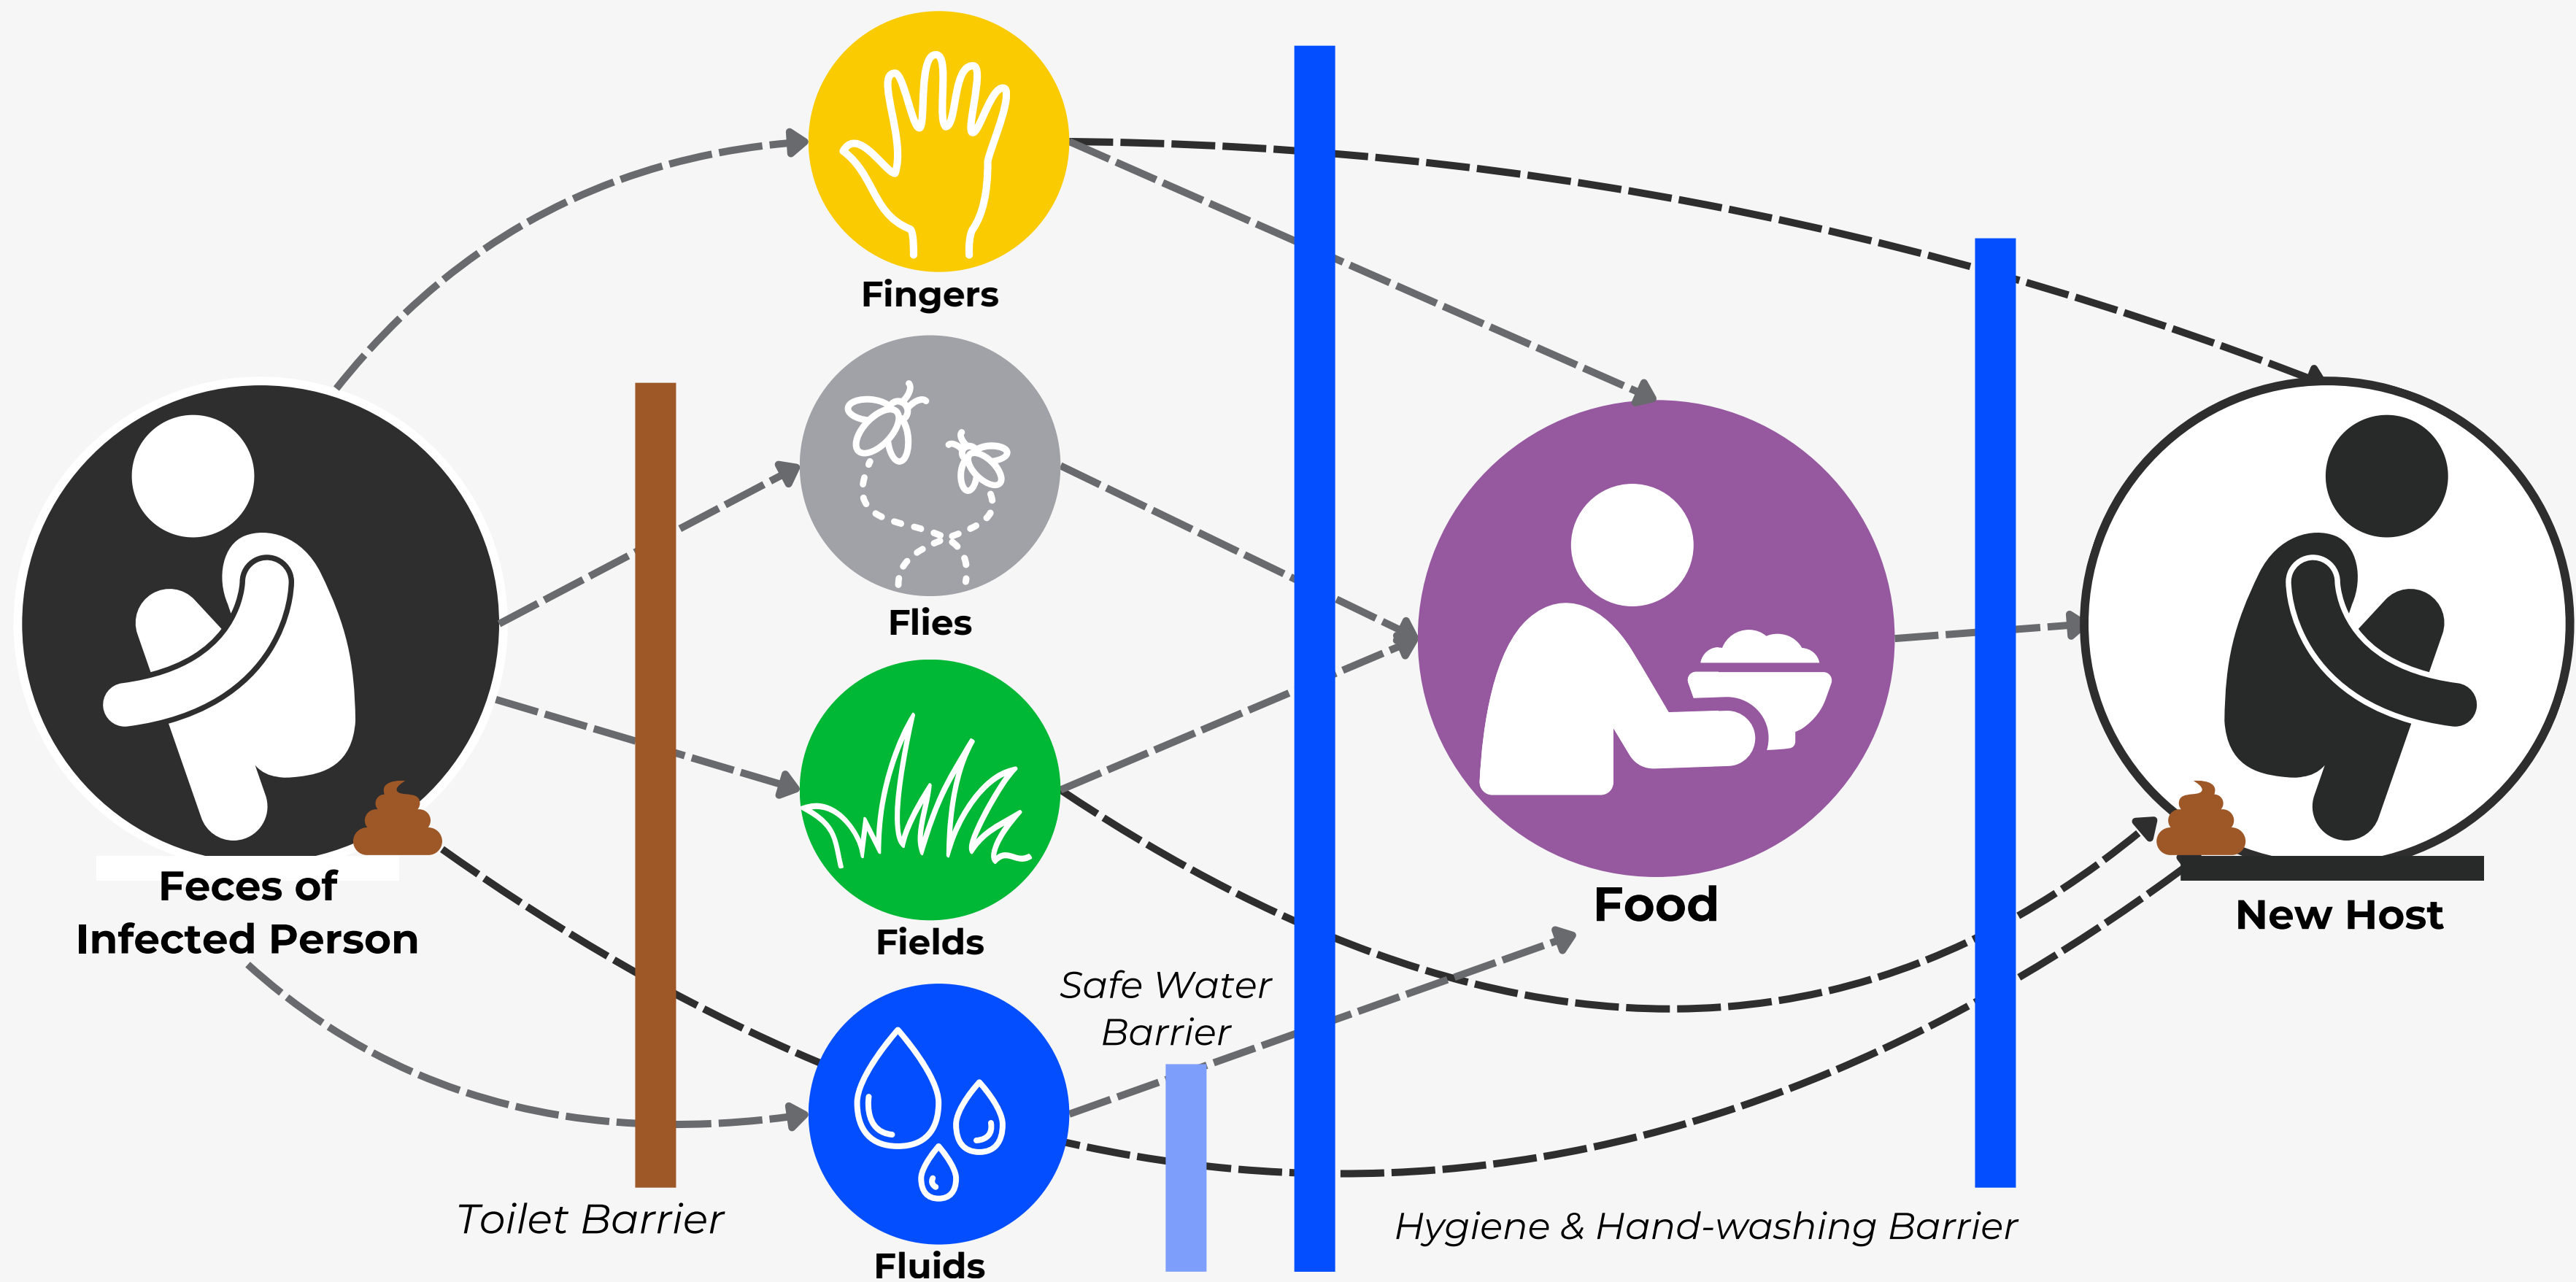

Fluids

5

Food

F-Diagram Walkthrough

What is the Philippines doing for sanitation?

Topic 4

**Zero Open
Defecation**

Zero Open Defecation (ZOD)

33%

*of barangays nationwide
are certified as ZOD*

67%

*barangays are still likely to
have households practicing
open defecation*

“

Zero Open Defecation is a program that aims to tackle the unsanitary practice of defecating (or discharging feces) in open areas or bodies of water rather than in a toilet.

”

**Why do you think open defecation
still happens in the Philippines?**

Community-Led Total Sanitation Approach

“

Community-Led Total Sanitation (CLTS)

initiatives are important because they empower communities to take charge of their own needs by promoting behavior change and the improvement of sanitation facilities.

This approach is key to achieving ZOD.

”

**Community
engagement**

**Long-term
behavior change**

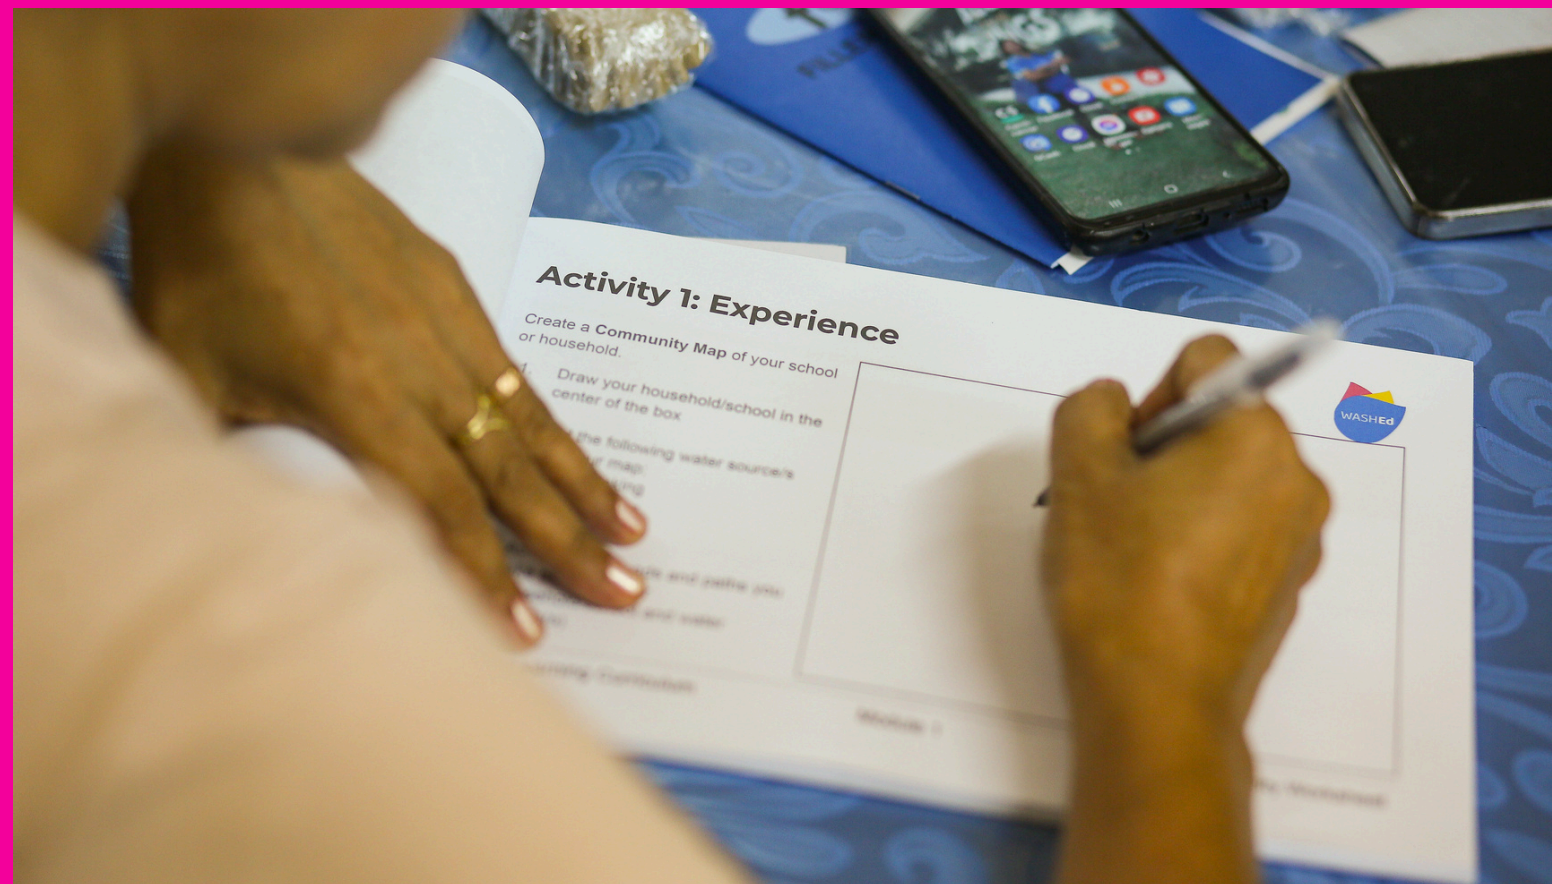

**Infrastructure
development**

Activities

for Module 4

- Classroom activities are designed using the **E-SPOT Framework** to engage Active Learning
- **Think-Pair-Share** approach is recommended for all activities

Activity 1: Experience

Activity 2: Share

Activity 3: Process & Observe

Activity 4: Try

Digital files for the classroom activities will be available from the WASH-Ed Learning Portal

Activity 1: Experience

Create a **Community Map** of your school or household.

1. Draw a map of your community and put your household/school in the center of the box.
2. Think about your neighbours or neighboring communities, and the different situation everyone faces.
3. Where known, mark an “**O**” in areas where open defecation is practiced.
4. Where known, mark an “**X**” in areas where houses may **not** have toilets or septic tanks.

Click to add text

Activity 2: Share

Share how sanitation is experienced in your schools, households, or communities. We will explore both Pros and Cons.

- For **ON-SITE**, describe the system in which human excreta (or feces) is collected, stored, and/or treated.
- For **CULTURAL**, describe how cultural experiences or traditional knowledge influence our attitude towards the handling of feces.

Experience/s	Pros	Cons
ON-SITE		
CULTURAL		

Activity 3: Process & Observe

Let us dive deeper to think about how the lack of toilets affects various groups of people in our lives, **differently**. Apply your learnings to identify the **disadvantages** these groups may face due to a lack of adequate toilets.

Activity 4: Try

Propose **three (3)** recommendations to raise awareness on the importance of sanitary toilets and change behaviours to help prevent open defecation practice in your homes, school, and communities.

1

HOME

2

SCHOOL

3

COMMUNITY
